- [3] Leucht S et al, Sixty Years of Placebo-Controlled Antipsychotic Drug Trials in Acute Schizophrenia: Systematic Review, Bayesian Meta-Analysis, and Meta-Regression of Efficacy Predictors, 2017, Amer Jof Psychiatry, <a href="https://goo.gl/bndxBq">https://goo.gl/bndxBq</a>
- [4] Leucht S et al, How effective are second-generation antipsychotic drugs? A meta-analysis of placebo-controlled trials, Molecular Psychiatry, 2009, PMID: 18180760, https://goo.gl/nhMXx2. Note: This meta-analysis shows that 41% of people respond (response is commonly defined as > 50% reduction in symptoms) to antipsychotics and 24% respond to placebo. Number Needed to Treat (NNT), recognized as the best approach to evaluate a treatment's true value, teases apart the "placebo value" of a treatment from its "medicinal value". This meta-analysis finds that 83% (100% (41%-24%)) of people with schizophrenia do NOT respond to antipsychotics medicinal value. Stated differently, less than 1 in 5 people see > 50% reduction in symptoms due to the antipsychotics.

- [7] Miller D, Extrapyramidal side-effects of antipsychotics in a randomised trial, Br J Psychiatry. 2008, PMC2801816. "...Table 1 probability of having a parkinsonism event within 1 year for people with no parkinsonism at baseline with adjustment for baseline covariates shows 37%—44% for the four second-generation antipsychotics and 37% for perphenazine". Note: we have used the midpoint percentage of 40% in the infographic. The data used is the large CATIE study from footnote #1.
